Nuclear medicine is a specialized area of radiology that uses very small amounts of radioactive substances to examine organ function and structure. It can also be used as a therapeutic approach to treat certain diseases. Nuclear medicine scans provide information about various organ functions by imaging the concentration of specially formulated radioactive chemical compounds in selected parts of the body.

Nuclear medicine imaging uses small amounts of radioactive materials called radiotracers that are typically injected into the bloodstream, inhaled or swallowed. The radiotracer travels through the area being examined and gives off energy in the form of gamma rays which are detected by a special camera and a computer to create images of the inside of your body.

Highly specialized and intricately operating equipment, including x-ray machines, MRI and PET scanners and many other devices provide most of modern medicine's diagnostic capability—along with ...

Nuclear engineering - Wikipedia

Nuclear medicine is a medical specialty involving the application of radioactive substances in the diagnosis and treatment of disease. Nuclear medicine imaging, in a sense, is "radiology done inside out" or "endoradiology" because it records radiation emitting from within the body rather than radiation that is generated by external sources like X-rays. In addition, nuclear medicine scans differ from radiology, as the emphasis is not on imaging anatomy, but on the function.
